

MPI-ESM1-2-LR | Annual Mean Near-Surface Temperature | Historical + SSP2-4.5 (r1)

Global mean
Ocean surface
Land surface
historical → SSP2-4.5

Interpretation:

Under largely historical forcing through the early 20th century, global, ocean, and land temperatures mainly show multidecadal variability without a sustained century-scale trend; after roughly the mid-20th century they rise together into the SSP2-4.5 projection, with the strongest warming toward 2100. Throughout, land remains warmer than the ocean and tends to warm more by the end of the century.
